Script-Controlled ACL – Restrict Record Access Based on Field Value

Phase 1 – Brainstorming & Ideation Phase

Team Leader: K. Amirthalakshmi | Team Members: Aisha Sahana S, Aishwarya S, Abirami S

Purpose

• Understand the record-access problem and identify a suitable ServiceNow solution.

Activity 1: Problem Framing

• Record access may need to depend on a field value.

• Role-only access may not meet a field-based business rule.

• Manual checking can be inconsistent.

Activity 2: Possible Approaches

• Manual checking.

• Role-based ACL.

• Script-Controlled ACL.

• External access-control application.

Activity 3: Idea Evaluation

• Script-Controlled ACL directly uses ServiceNow ACL capability.

• It can evaluate a record field and return an access decision.

• It can be tested with allowed and restricted values.

Script-Controlled ACL – Restrict Record Access Based on Field Value

Phase 1 – Brainstorming & Ideation Phase – Continued

Activity 4: Final Idea

• Create an ACL that checks a selected field value and controls the required record operation.

Activity 5: Scope

• In scope: table, controlled field, ACL, script, testing, documentation and demonstration.

• Out of scope: unrelated external applications and unnecessary features.

Activity 6: Stakeholders

• Users need consistent access control.

• Administrators need maintainable configuration.

• Evaluators need clear working evidence.

Activity 7: Risks and Assumptions

• Incorrect script logic may produce the wrong result.

• Testing both positive and negative conditions reduces this risk.

Activity 8: Success Criteria

• Allowed condition gives expected access.

• Restricted condition prevents access.

• Behavior is repeatable.

Outcome

• The project direction, scope, stakeholders, risks and success criteria are defined.
