Script-Controlled ACL – Restrict Record Access Based on Field Value

Phase 2 – Requirement Analysis Phase

Team Leader: K. Amirthalakshmi | Team Members: Aisha Sahana S, Aishwarya S, Abirami S

Purpose

• Convert the project idea into clear functional and non-functional requirements.

Functional Requirements

• Use the selected ServiceNow table.

• Use the selected field for the access decision.

• Create the required ACL.

• Evaluate the field value through the configured logic.

• Support positive and negative testing.

User and Administrator Requirements

• Users must be subject to the configured rule.

• Administrators must identify the ACL and condition.

• Testers must use records representing different values.

Data Requirements

• Record data.

• Controlled field value.

• Value satisfying the rule.

• Value not satisfying the rule.

Script-Controlled ACL – Restrict Record Access Based on Field Value

Phase 2 – Requirement Analysis Phase – Continued

Non-Functional Requirements

• Security: access must follow the ACL.

• Reliability: the same condition should give a consistent result.

• Maintainability: logic should remain focused and understandable.

• Testability: behavior must be verifiable.

ServiceNow Requirements

• Assigned ServiceNow instance.

• Required table and field.

• Applicable ACL operation.

• ACL condition/script.

• Required test users and records.

Acceptance Conditions

• Required configuration is available.

• ACL can evaluate the selected field.

• Allowed and restricted cases can be tested.

• Actual results are recorded.

Outcome

• The requirement baseline is ready for design and implementation.
