Script-Controlled ACL – Restrict Record Access Based on Field Value

Phase 5 – Project Development Phase

Team Leader: K. Amirthalakshmi | Team Members: Aisha Sahana S, Aishwarya S, Abirami S

Purpose

• Implement the Script-Controlled ACL in the ServiceNow environment.

Environment Setup

• Open the assigned ServiceNow instance.

• Confirm required permissions.

• Identify the project table and field.

Table and Field Setup

• Configure the required table.

• Configure the controlled field.

• Prepare records with different field values.

ACL Creation

• Open ACL configuration.

• Create the ACL for the required table and operation.

• Configure required conditions.

• Add the field-value checking logic.

Script-Controlled ACL – Restrict Record Access Based on Field Value

Phase 5 – Project Development Phase – Continued

Script Logic

• Read the selected field value.

• Compare it with the configured condition.

• Return the required access decision.

Development Verification

• Check table and operation.

• Check field reference.

• Test an allowed value.

• Test a restricted value.

Error Checking

• Review field value, ACL configuration, user permissions and script when behavior is unexpected.

Evidence

• Use actual configuration evidence and useful frames from the existing screen recording.

Outcome

• The ServiceNow implementation is ready for formal testing.
